- **Orchestrate processes and data movement with Microsoft Fabric**

- Laboratorio 2: **Ingest data with a pipeline in Microsoft Fabric**

Ingest data with a pipeline in Microsoft Fabric |

A data lakehouse is a common analytical data store for cloud-scale analytics solutions. One of the core tasks of a data engineer is to implement and manage the ingestion of data from multiple operational data sources into the lakehouse. In Microsoft Fabric, you can implement extract, transform, and load (ETL) or extract, load, and transform (ELT) solutions for data ingestion through the creation of pipelines.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/04-ingest-pipeline.html>

- **Use Apache Spark in Microsoft Fabric**

- Laboratorio 3: **Analyze data with Apache Spark in Fabric**

Analyze data with Apache Spark in Fabric |

In this lab you will ingest data into a Fabric lakehouse and use PySpark to read and analyze the data.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/02-analyze-spark.html>

- **Work with real-time data in an Eventhouse in Microsoft Fabric**
 - Laboratorio 4: **Work with data in a Microsoft Fabric eventhouse**

Work with data in a Microsoft Fabric eventhouse |

In Microsoft Fabric, an eventhouse is used to store real-time data related to events; often captured from a streaming data source by an eventstream.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/12-query-data-in-kql-database.html>

Ruta de Aprendizaje 2: Implement a Lakehouse with Microsoft Fabric

- **Get started with lakehouses in Microsoft Fabric.**
 - Laboratorio 5: **Create a Microsoft Fabric Lakehouse**

Create a Microsoft Fabric Lakehouse |

Large-scale data analytics solutions have traditionally been built around a data warehouse, in which data is stored in relational tables and queried using SQL. The growth in “big data” (characterized by high volumes, variety, and velocity of new data assets) together with the availability of low-cost storage and cloud-scale distributed compute technologies has led to an alternative approach to analytical data storage; the data lake. In a

- **Work with Delta Lake tables in Microsoft Fabric**
 - Laboratorio 6: **Use delta tables in Apache Spark**

Use Delta Tables in Apache Spark |

Tables in a Microsoft Fabric Lakehouse are based on the open-source Delta Lake format. Delta Lake adds support for relational semantics for both batch and streaming data. In this exercise, you'll create managed Delta tables using PySpark and SQL, explore table versioning, and work with streaming data.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/03-delta-lake.html>

- **Organize a Fabric lakehouse using medallion architecture design**
 - Laboratorio 7: **Create a medallion architecture in a Microsoft Fabric lakehouse**

Create a medallion architecture in a Microsoft Fabric lakehouse |

In this exercise you will build out a medallion architecture in a Fabric lakehouse using notebooks. You will create a workspace, create a lakehouse, upload data to the bronze layer, transform the data and load it to the silver Delta table, transform the data further and load it to the gold Delta tables, and then explore the semantic model and create relationships.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/03b-medallion-lakehouse.html>

Ruta de Aprendizaje 3 : Implement Real-Time Intelligence with Microsoft Fabric

- **Get started with Real-Time Intelligence in Microsoft Fabric**
 - Laboratorio 8: **Get started with Real-Time Intelligence in Microsoft Fabric**

Get started with Real-Time Intelligence in Microsoft Fabric |

Microsoft Fabric provides Real-Time Intelligence, enabling you to create analytical solutions for real-time data streams. In this exercise, you'll use the Real-Time Intelligence capabilities in Microsoft Fabric to ingest, analyze, and visualize a real-time stream of stock market data.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/07-real-time-Intelligence.html>

- **Use Eventstream in Microsoft Fabric**

- Laboratorio 9: **Ingest real-time data with Eventstream in Microsoft Fabric**

Ingest real-time data with Eventstream in Microsoft Fabric |

Eventstream is a feature in Microsoft Fabric that captures, transforms, and routes real-time events to various destinations. You can add event data sources, destinations, and transformations to the eventstream.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/09-real-time-analytics-eventstream.html>

- **Create Real-Time Dashboards with Microsoft Fabric**

- Laboratorio 10: **Get started with real-time dashboards**

Get started with Real-Time Dashboards in Microsoft Fabric |

Real-time dashboards in Microsoft Fabric enable you to visualize and explore streaming data using the Kusto Query Language (KQL). In this exercise, you'll explore how to create and use a real-time dashboard based on a real-time data source.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/13-real-time-dashboards.html>

- **Use Activator in Microsoft Fabric**

- Laboratorio 11: **Use Activator in Fabric**

Use Activator in Fabric |

Activator in Microsoft Fabric takes action based on what's happening in your data. An Activator lets you monitor your data and create triggers to react to your data changes.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/11-data-activator.html>

Ruta de Aprendizaje 4: Implement a data warehouse with Microsoft Fabric

- **Get started with data warehouses in Microsoft Fabric**

- Laboratorio 12: **Analyze data in a data warehouse**

Analyze data in a data warehouse |

In Microsoft Fabric, a data warehouse provides a relational database for large-scale analytics. Unlike the default read-only SQL endpoint for tables defined in a lakehouse, a data warehouse provides full SQL semantics; including the ability to insert, update, and delete data in the tables.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/06-data-warehouse.html>

- **Load data into a Microsoft Fabric data warehouse**

- Laboratorio 13: **Load data into a warehouse using T-SQL**

Load data into a warehouse using T-SQL |

In Microsoft Fabric, a data warehouse provides a relational database for large-scale analytics. Unlike the default read-only SQL endpoint for tables defined in a lakehouse, a data warehouse provides full SQL semantics; including the ability to insert, update, and delete data in the tables.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/06a-data-warehouse-load.html>

- **Query a data warehouse in Microsoft Fabric**

- Laboratorio 14: **Query a data warehouse in Microsoft Fabric**

Query a data warehouse in Microsoft Fabric |

In Microsoft Fabric, a data warehouse provides a relational database for large-scale analytics. The rich set of experiences built into Microsoft Fabric workspace enables customers to reduce their time to insights by having an easily consumable, always connected semantic model that is integrated with Power BI in DirectLake mode.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/06b-data-warehouse-query.html>

- **Get started with Copilot in Microsoft Fabric for Data Warehouse**

- Laboratorio 15: **Use Copilot in Microsoft Fabric data warehouse**

Use Copilot in Microsoft Fabric data warehouse |

In Microsoft Fabric, a data warehouse provides a relational database for large-scale analytics. Unlike the default read-only SQL endpoint for tables defined in a lakehouse, a data warehouse provides full SQL semantics; including the ability to insert, update, and delete data in the tables. In this lab, we will explore how we can leverage Copilot to create SQL Queries.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/22c-copilot-fabric-data-warehouse.html>

- **Monitor a Microsoft Fabric data warehouse**

- Laboratorio 16: **Monitor a data warehouse in Microsoft Fabric**

Monitor a data warehouse in Microsoft Fabric |

In Microsoft Fabric, a data warehouse provides a relational database for large-scale analytics. Data warehouses in Microsoft Fabric include dynamic management views that you can use to monitor activity and queries.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/06c-monitor-data-warehouse.html>

- **Secure a Microsoft Fabric data warehouse**

- Laboratorio 17: **Secure data in a data warehouse**

Secure data in a data warehouse |

Microsoft Fabric permissions and granular SQL permissions work together to govern Warehouse access and user permissions. In this exercise, you'll secure data using granular permissions, column-level security, row-level security, and dynamic data masking.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/06d-secure-data-warehouse.html>

Ruta de aprendizaje 5: Manage a Microsoft Fabric environment

- **Implement continuous integration and continuous delivery (CI/CD) in Microsoft Fabric**

- Laboratorio 18: **Implement deployment pipelines in Microsoft Fabric**

Implement deployment pipelines in Microsoft Fabric |

Deployment pipelines in Microsoft Fabric let you automate the process of copying changes made to the content in Fabric items between environments like development, test, and production. You can use deployment pipelines to develop and test content before it reaches end users. In this exercise, you create a deployment pipeline, and assign stages to the pipeline. Then you create some content in a development workspace

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/21-implement-cicd.html>

- **Monitor activities in Microsoft Fabric**

- Laboratorio 19: **Monitor Fabric activity in the monitoring hub**

Monitor Fabric activity in the monitoring hub |

The monitoring hub in Microsoft Fabric provides a central place where you can monitor activity. You can use the monitoring hub to review events related to items you have permission to view.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/18-monitor-hub.html>

- **Secure data access in Microsoft Fabric**

- Laboratorio 20: **Secure data access in Microsoft Fabric**

Secure data access in Microsoft Fabric |

Microsoft Fabric has a multi-layer security model for managing data access. Security can be set for an entire workspace, for individual items, or through granular permissions in each Fabric engine. In this exercise, you secure data using workspace and item access controls and OneLake security roles.

<https://microsoftlearning.github.io/mslearn-fabric/Instructions/Labs/19-secure-data-access.html>
